**NOTE: Marina Water Standard = 7**  
**Inland Water Standards = 33-35**

**\*\* Enterococcus 7 per 100ml is state requirement - Federal requirement is 35 per 100ml**

Enterococcus: Bacteria normally found in the feces of people and many animals. Two types of enterococci - Enterococcus faecalis and Enterococcus faecium - occasionally cause human disease, most commonly urinary tract infections and wound infections. Other infections, including those of the blood stream (bacteraemia), heart valves (endocarditis) and the brain (meningitis) can occur in severely ill patients in hospitals. Enterococci also often colonize in open wounds and sin ulcers.
